

ABSTRACT OF THE DISCLOSURE

A mounting system and method for an antenna and access point of a wireless local area network communication system. The antenna and access point are mounted on top of a board member, and a protective cover is mounted on board member over the
5 antenna. The board member can then be placed on a support surface such as the top of a suspended ceiling and the access point connected to the input cabling of the local area network communication system. The board member can then freely moved around to fine-tune the area of coverage of the access point.
